WiP Leadership | Skilling & Networking

Why patterns matter

40%

of agentic AI projects will be canceled by the end of 2027 due to escalating costs, unclear business value, and inadequate risk controls.

2× the AI impact

Organizational design drives 2× the AI impact of individual effort i.e., how you build around AI matters more than the AI

Patterns are reusable blueprints

- Accelerate delivery, start from proven, not from scratch
- Bake in consistency & governance by default
- Give fusion teams a shared language
- Reduce technical debt and model drift

Learn it once. Apply it everywhere.

The P.O.W.E.R Framework

Turn AI ideas into actionable, auditable, and enterprise-grade outcomes

P.O.W.E.R. in the age of agents

P

Agent instructions, persona & guardrails (Purpose + Policy)

M365 Agent Builder, Copilot, Copilot Studio, Azure Foundry

O

Evals + observability - not just metrics

Power BI · App Insights · evals

W

Tools: flows + connectors + MCP + multi-agent

M365 · Azure · Power Automate · MCP · Agent Framework

E

Grounding on YOUR data (RAG)

Azure AI Search · SharePoint · Dataverse

R

Feedback loop + version control

Dataverse · feedback loops

Govern it like an employee: every agent gets an identity - Entra Agent ID - with lifecycle, access & audit.

Approaches to Agent Delivery

The 5 patterns at a glance

1 Conversational AI Orchestration

"It's not the bot - it's the orchestration behind it."

Use when: users need to DO things via chat

2 Document Intelligence Pipeline

"Extract once, reuse forever."

Use when: you're drowning in PDFs & forms

3 Workflow Automation / Human-in-the-Loop

"Automate the boring, elevate the human."

Use when: a decision needs a human gate

4 Context-Aware Assistants (RAG)

"Generic AI is useless. Context is everything."

Use when: answers must cite YOUR data

5 Feedback-Driven Continuous Learning

"Ship fast. Learn faster."

Use when: it must improve in production

LIVE DEMO

Use the LLM for language, not for ledgers.

The Smart Proposal Review Agent · Patterns 1 + 2 + 4

The 3 gotchas

Images

Vision models misread and hallucinate on low-quality scans, logos, and handwriting.

Guardrail: purpose-built OCR + confidence scores not raw pixel reading.

OCR

Transposed digits, merged fields, decimal drift a \$1,250 invoice becomes \$12.50.

Guardrail: a validation layer + human review below a confidence threshold.

Math

LLMs predict the next token they don't calculate. Totals are confident and not reliable.

Guardrail: deterministic compute models, pro-code, Power Automate / Office Scripts do the arithmetic.

Right tool, right job: the LLM reasons, the platform calculates..

THESE APPLY TO ALL FIVE PATTERNS

Cross-pattern best practices

Architecture

- Design for scale from day one
- Decouple Copilot $\neq$ Workflow $\neq$ Data
- Env variables + managed identities

Governance

- Audit trails everywhere (Dataverse)
- Version prompts like code
- Data residency & DLP by design

User Experience

- Set clear expectations: AI vs human
- Design for failure gracefully
- Let users flag/correct in context

Operations

- Monitor OpenAI consumption & cost
- Alert on anomalies
- Plan model versioning & rollback

“An agent without a pattern is just a very confident intern.”

The future is low-code + AI - and you're leading it.

Your next steps: 1) Pick one pattern 2) Wrap it in P.O.W.E.R. 3) Ship a governed pilot

Questions?

Let's talk patterns, governance, or that invoice gotcha.
